

3. Agile Model

Wednesday, July 15, 2026 3:07 PM

The Agile methodology is a way to manage a project by breaking it up into several phases. It involves constant collaboration with stakeholders and continuous improvement at every stage. Once the work begins, teams cycle through a process of planning, executing, and evaluating

Teams choose to adopt an Agile approach because it helps break workloads into manageable chunks, drive continual improvement of products and internal processes, and typically results in faster, incremental delivery.

In contrast to a Waterfall Methodology, which is a linear approach building up to a more definitive 'launch', Agile results in gradual but continual improvement. It's ongoing, more flexible and adaptable to change, producing outcomes faster and improving them over time

Iterative Waterfall Model was very popular for completing a project in early days. But nowadays, developers face various problems while using it like handling customer change requests during project development and the high cost and time required to incorporate these changes. In the mid-1990s, the Agile Software Development Model was proposed to overcome these drawbacks of the Waterfall Model.

Primarily designed to help a project adapt change requests quickly. The main aim is to facilitate quick project completion. To accomplish this task, it is important that agility is achieved. Agility is achieved by adapting the development process to suit the specific project, eliminating unnecessary activities that do not add value, and avoiding tasks that waste time and effort. The Agile Model is not a single method but a collection of development approaches.

Agile Manifesto

The Agile Manifesto is a document that identifies four key values and 12 principles that its authors believe software developers should use to guide their work. Formally called the Manifesto for Agile Software Development, it was produced by 17 developers during an outing on Feb. 11-13, 2001, at The Lodge at Snowbird ski resort in Utah.

The developers called themselves the Agile Alliance. They were seeking an alternative to the existing software development processes that they saw as complicated, unresponsive and too focused on documentation requirements. Among the developers were Kent Beck, Arie van Bennekum, Alistair Cockburn, Andrew Hunt, Robert Martin and Jeff Sutherland. Members of the initial alliance were experienced in software development and business entrepreneurship.

Agile project management brings together Agile teams of programmers, stakeholders and users to support Agile principles. Team members conduct face-to-face conversations, both in person and remotely, and they communicate regularly as part of the primary measure of progress. This approach supports the key aspect of the Agile process -- developing software in increments with user input along the way, as opposed to a final product with minimal user interaction.

- Agile Methodology operates according to its [Manifesto](#) which contains four, core principles:

The 4 Values of Agile

The four core values of Agile software development as stated in the Agile Manifesto are as follows:

- Individuals and interactions over processes and tools.
- Working software over comprehensive documentation.
- Customer collaboration over contract negotiation.
- Responding to change over following a project plan.

The 12 Principles

The Agile Manifesto goes beyond scoping out a software project and then developing and releasing it. Perhaps the most important aspect of the manifesto is the close coordination and regular interactions with those who will be using the new or updated software.

The following are the 12 principles of the Agile Manifesto:

- Meeting end users' needs with early and continuous delivery of work.
- Being open to changes in requirements even late in the project.
- Delivering completed work at regular intervals, preferably short ones.
- Working with the project team and business owners daily.
- Assembling a motivated team, providing them with the right environment and support, and trusting them.
- Communicating face-to-face regularly.
- Using completed work to measure progress.
- Creating processes that promote sustainable efforts and a constant pace of work.
- Requiring continuous attention to excellence through good design.
- Encouraging simplicity.
- Recognizing that the best work emerges from self-organized teams that deliver the best architectures and designs.
- Reflecting regularly on how the team can be more effective and fine-tuning and adjusting the approach.

Agile Framework

An agile framework can be defined as a specific Software-Development Approach based on the Agile Philosophy articulated in the Agile Manifesto. Most agile teams use frameworks only as a starting point for their agile transformation, eventually customizing elements to meet their unique needs. Various organizations use many popular frameworks. Often these organizations modify parts of the frameworks as they see fit and iterate on their own agile processes.

Popular Frameworks

- Scrum It is about managing knowledge work, with an assurance on the new improvement of the software. It was created for small teams that are consist of three to nine members, they will divide their tasks to a number of activities which will be done inside the timeboxed iterations, called " sprints ", and these activities will not exceed one month to be done and most usually couple of weeks to finish these activities, at that point tracking the progress and then planning again in 15-minute stand-up gatherings, called day by day scrums.
